What is Photoshop?
Originally called
Photoshop Elements,
Photoshop was originally
released in 1995 as a
standalone product and
later became a section of
Adobe Illustrator CS.
Photoshop is used for
editing raster image
formats such as JPEGs,
but also other images

such as TIFs. Adobe created Photoshop using a layer-based design system that allows for raster image editing using multiple layer overlays. Photoshop is a raster image editor, unlike GIMP, which is a vector image editor.

What does Photoshop do? In Photoshop, images are made up of layers, and new layers are normally

added on top of a layer to make a new image. Layers may contain raster images, text, and background colors. Layers may be visible or invisible, and some objects may be visible only if they are on top of another visible object. Photoshop layers may be grouped together to form a complete image. They can be grouped together

with other objects by selecting an object and pressing the Ctrl + G keyboard shortcut to group the objects together. When you select the Group Layers tool, you can add, remove, move, and rearrange layers in a group. Layers can contain both raster and vector objects. They may be used to edit objects

on other layers, such as adding or deleting objects or text, although that is not the primary method of editing. You can edit objects on layers with the direct selection tool or by using the Paths palette to make selections. When you create a new image, you begin with a blank, or "empty," canvas and add layers to it. You can also

load older files, and you can ungroup layers to make them visible again. In addition, you can open vector images in Photoshop to edit them as you would with a vector program like Illustrator. What does Photoshop cost? Adobe Photoshop software can cost from \$250 to \$2,500. For beginners, it is best to use

Photoshop's free software, Photoshop Elements, which is available for both Windows and OS X. Elements can be used to create simple images that do not require adjustments. For more advanced editing, Elements is not a perfect substitute for Photoshop, but it can be used as a good starting point

before learning how to use Photoshop. However, Photoshop offers much more editing power. Learning how to use Photoshop takes time, but it can quickly become a part of a designer's workflow.

Q: Why is Python `dict.get()` faster than `list.index()`? I was writing a function to remove an element from list and I noticed that the `dict.get()` is faster than `list.index()`.

Example: `def remove(a,i): a=list(a)
print(a.index(i)) return
a.pop(i) def remove(a,i):
a=list(a) return`

dict.get(a,i)
a=range(1000) %timeit
remove(a,500) 1000
loops, best of 3: 1.01 ms
per loop %timeit
remove(a,500) 100 loops,
best of 3: 4.65 ms per
loop Why is dict.get()
faster than list.index?
EDIT: I expected
list.index to be fastest.
I'm not sure why this is
happening. A: While in
Python 2 index() will

iterate the entire list to find the index, in 3 it uses a bounds checking, which will be an order of magnitude faster. Python 2.7.9 (default, Mar 26 2014, 15:59:41) >>> import itertools >>> import random >>> a = list(range(1000)) >>> %timeit a.index(random.randrange(len(a))) 10000 loops, best of 3: 98.7 usec per loop >>> a =
